

## **Trelleborg Exhibits Range Of Mineral Extraction Screens At Hillhead Exhibition 2014**

As a world leader in molded polyurethane materials, Trelleborg's polyurethane products limited (PPL) operation will showcase its range of high quality screening solutions and accessories for mining processing, at the Hillhead Exhibition in Buxton, UK.

Located on stand PC26, the company will give visitors the chance to see its portfolio of screening systems, including its Scandura modular and tensioned offerings.

Paul Hobson, Scandura Sales Manager within Trelleborg Offshore and Construction in Nottingham, UK commented: "Our specialized polymer materials are used to create a corrosion resistant, light-weight and flexible alternative to conventional steel wire screens used in the mineral and extraction industry. With a full range of polyurethane ancillaries, including skirting, pump impellers and many other accessories, we offer a complete polyurethane product line to the quarrying and mining industries.

"Hillhead provides us with the ideal environment to really listen to our customers product needs and allows us to ensure that our solutions truly align with their requirements. We utilize our engineering expertise in molded polyurethane materials to ensure we perform at every level to meet industry demands."

Among the extensive range of screening media and accessories being showcased is Trelleborg's Scadura

tensioned system. This corrosion resistant, polyurethane screen is self-supporting, eliminating the need to bolt the mat to the support frame. The Scandura screen mat is abrasion and impact resistant, meaning that replacement is less frequent and can in fact be scheduled, reducing unplanned downtime and loss of production.

Hillhead is the world's biggest and best show set in a real working quarry environment. It provides a showcase for plant, equipment and services for the quarrying, construction and recycling industries and is supported by 450 leading international exhibitors.
