

## Further Eickhoff Shearers for the Balkan Region

The steady success story of Eickhoff's growing population of high performance shearer loaders in Bosnia is backed by two new orders from the region.

The path into a new generation of high performance mining with top-of-the-line equipment was already paved some years back when the two mines Breza and Banovice from Bosnia each decided to install high-performance shearer loaders of the type Eickhoff SL 300.

The current population of six Eickhoff SL shearers spread over the entire Balkan region is now supplemented by two additional high performance shearer loaders of the type Eickhoff SL 300, which define the global standard for KPI and Life Cycle Costs in low- and medium-high longwall faces. A recent delivery went to the customer Kakanj in Bosnia while in September a further contract was signed with the customer Zenica where the shearer will be deployed to its Raspotocje mine. Both of these new projects will be carried out with Eickhoff's long term cooperating partner Becker Warkop of Poland, which is acting as the main project partner, delivering the full longwall setup. Further projects and orders are visible on the horizon and Eickhoff is confident to remain the top supplier of world-class equipment into the region, thus empowering domestic energy producers on their road to success in delivering independent and reliable energy from domestic sources.

Since its foundation in 1864 Eickhoff has been specializing in underground coal mining equipment. Today, Eickhoff is a successful German based global supplier of longwall shearers and continuous miners with more than 150 years of experience.

Experience has no substitute • Eickhoff since 1864
